No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                          9
                                                                                                                            caenorhabditis elegans, with 2 pore-forming domains between transmembrane helix domains. The sequence has been isolated by complementation of the potassium-dependent phenotype of Saccharomyces cerevisiae CY162 (trk1-delta) on low-potassium medium. A consensus polyadennylation site is found in the 3 'untranslated sequence, and is followed by a tract of 15 consecutive A residues. The DNA may be inserted in a vector and expressed in a host cell to assay substances to determine effects on cell growth. Potassium-agonists or potassium-antagonists identified by this method may be used as nematocides, anthelminthics or in therapy of cardiac
                                                   Potassium channel genes from Drosophila melanogaster and Caenorhabditis elegans - useful in assaying substances to determine effects on cell growth, and in inhibiting nematode and insect pests
                                                                                                                                                                                                                                                                                                                                                                                           aacgcaagcattaatgttttcaacctgttcctcattattgctggtcccctgatctaccgc

                                               The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,

                                                                                                                                                                                                                                                                                            The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,

                                                                                                                              The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (FTM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               890 acgatgaaatctacactttgctcacaagtttcctcgtcttcaatttgttcgctgcgattg 949
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    424
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            484

                                                                                                                                                                                                                                                                1250 gtggcctgtggcccgttgttattgagcacttcgtggacaagccaagtatcttataaatat 1309
                                                                                                                                                                                                                                                                                                                                 The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             gatccatagttgcttccaagattcactggccgacaccccgttacctcaaatttgccataa 1009
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) mon single-nucleotide polymorphisms, e.g. for genotyping, monitoring gene expression.

                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    364
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             650 ttttctttatcacaaagcaagatttctaccactatcaccatcaaaaaggaatggaattc 709
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              710 gcgaaaaggcggaaaccgacagaccgtctccatccattctttggaccacattcacaaact

                                                                           The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     642 aattgcacttttctttatcacaaagcaagatttctaccactatcaccatcaaaaaggaat 701

                                                                                                                              The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping, monitoring gene expression.

Nucleic acids containing electron-transfer group, useful as labels in hybridization assays, e.g. for genotyping, allowing repeat analyses on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  642 aattgcacttttctttatcacaaagcaagatttctaccactatcaccatcaaaaaggaat 701

The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches)

                                                                                                                                                 The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              aattgcacttttctttatcacaaagcaagatttctaccactatcaccatcaaaaaggaat 701
                                                                                                                                                                                                                                                                                                                                                   The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,

                                                                                                                                                                                                                                   The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

```

```
The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping, monitoring gene expression.

Xho I; Filarial nematode parasite of humans. Third-stage
larvae, L3, were isolated from infected black files in
Cameroon (forest strain). The L3 were cultured in 20% FCS
in IMDM+ NTC 135 and collected after day 1, 2, or 3 in
culture. L3 of 0. volvulus molt to fourth-stage larvae by
day 5 in culture. mRNA was isolated from approximately
day 5 in culture. mRNA was isolated from approximately
6000 molting larvae (mL3), 2000 larvae from day 1, 2 or 3
in culture, and converted to double-stranded cDNA using
reverse transcriptase and oligo(dT) followed by RNASE H
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Eukaryota; Metazoa; Nematoda; Chromadorea; Spirurida; Filarioidea;

- Determination of this BAC-end sequence was carried out as part of a collaboration with the Berkeley Drosophila Genome Project (BDGP). The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Gsoegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial EcoRI digestion of Drosophila DNA provided by the BDGP from the isogenic strain y2; cn bw sp. the same strain used for the BDGP's pl and EST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be found at http://bacpac.med.buffalo.edu/drosophila_bac.htm.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ;

Onchocerca volvulus
Eukaryota, Metazoa, Nematoda, Chromadorea, Spirurida, Filarioidea,
transcriptase and oligo(dT) followed by RNase H and DNA pol I. The library has 5 x 10f6 independent recombinants and the average insert size is -900bp.The library was constructed by Michelle Lizotte-Waniewski. The library is available from Dr.S.A.Williams, email:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Contact: Steven A. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                         Sequence 14,

EQUILIBRATIVE NUCLEOSIDE TRANSPORTER 2 (EQUILIBRATIVE
NITROBENZYLMERCAPTOPURINE RIBOSIDE-INSENSITIVE NUCLEOSIDE TRANSPORTER)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        INDUCTION: BY PLATELET DERIVED GROWTH FACTOR (PDGF) AND FIBROBLAST GROWTH FACTOR (FGF).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Biochem. Biophys. Res. Commun. 213:325-333(1995).

-!- FUNCTION: MEDIATES EQUILIBRATIVE TRANSPORT OF PURINE, PYRIMIDINE NUCLEOSIDES AND THE PURINE BASE HYPOXANTHINE. LESS SENSITIVE THAN SLC29A1 TO: INHIBITION BY NITROBENZYLTHIOINOSINE (NBMPR), DIPYRIDAMOLE, DILAZED AND DRAFLAZINE.

-!- SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN. HNP36 ISOFORM IS A NUCLEOLAR INTEGRAL MEMBRANE PROTEIN.

-!- ALTERNATIVE PRODUCTS: 2 ISOFORMS; A LONG FORM (SHOWN HERE) AND A SHORT FORM/HNP36; SEEMS TO BE PRODUCED BY ALTERNATIVE SPLICING.
-!- TISSUE SPECIFICITY: EXPRESSED IN PLACENTA, BRAIN, HEART AND
                                                                                                                           (EQUILIBRATIVE NBMPR-INSENSITIVE NUCLEOSIDE TRANSPORTER) (NUCLEOSIDE TRANSPORTER, ELTTPEP) (36 KDA NUCLEOLAR PROTEIN HNP36) (HYDROPHOBIC NUCLEOLAR PROTEIN, 36 KDA) (DELAYED-EARLY RESPONSE PROTEIN 12). SLC29A2 OR ENTZ OR HNP36 OR DER12.
                                                                                                                                                                                                                                                                                                                                             MEDLINE-98148080; PubMed-9478986;

                                                                                                                                                                  RIBOSIDE (NBMPR) AND IS SODIUM-INDEPENDENT. SPECIFIC FOR NUCLECSIDES, BUT MAY ALSO TRANSPORT HYPOXANTHINE. MAY ALSO PLAY A ROLE IN THE EFFLUX OF INOSINE AND HYPOXANTHINE FROM MUSCLE CELLS DURING THE NET DEGRAPATION OF PURINE NUCLECTIDES THAT OCCURS DURING STRENUOUS EXERCISE AND/OR IN THE REUPTAKE OF THESE PURINES DURING THE RECOVERY PROCESS (BY SIMILARITY).
                                         "Molecular closing and functional characterization of nitrobenzylthioinosine (RBMPR)-sensitive (es) and NBMPR-insensitive (el) equilibrative nucleoside transporter proteins (rENT1 and rENT2) from rat tissues.";
J. Biol. Chem. 272:28423-28430(1997).
I FIOLTION: MEDIAFTES BOTH INFLUX AND EFFLUX OF NUCLEOSIDES ACROSS - FUNCTION: MEDIAFTES BOTH INFLUX AND EFFLUX OF NUCLEOSIDES ACROSS THE MEMBERANE (EQUILIBRATIVE TRANSPORTER). IT IS INSENSITIVE (EI) TO LOW CONCENTRATIONS OF THE INHIBITOR NITROBENZYLMERCAPTODURINE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          70 MGSLTIGSQLPNASINVFNLFLIIAGPLIYRVFAPVCFNIVNLTIILILVIVLEPTEDSM 129

EQUILIBRATIVE NUCLEOSIDE TRANSPORTER 1 (EQUILIBRATIVE
NUTROBENZIMERCAPTOPURINE RIBOSIDE-SENSITIVE NUCLEOSIDE TRANSPORTER)
(EQUILIBRATIVE NUMPR-SENSITIVE NUCLEOSIDE TRANSPORTER)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       BIOL. Chem. 272:28423-28430(1997).

FUNCTION: MEDIATES BOTH INFLUX AND EFFLUX OF NUCLEOSIDES ACROSS THE MEMBRANE (EQUILIBRATUVE TRANSPORTER). IT IS SENSITIVE (ES) TOW CONCENTRATIONS OF THE INHIBITOR NITROBENZYLMERCAPPOPURINE RIBOSIDE (NBMPR) AND IS SODIUM-INDEPENDENT. IT HAS A HIGHER AFFINITY FOR ADENOSINE. RESISTANT TO DIPYRIDAMOLE AND DILAZEP INHIBITION (ANTICANCER CHEWOTHERAPEUTICS DRUGS).

SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN.
                                                                                                                                                                                                                                                      AELLGADEKNGIPVSPQQAGPTLDLDPEKELELGLEEPQKPGKPSVFVVFRKIWLTALCL
